Abstract

This article contains Z Notation type declarations for vector spaces and some related objects. It has been type checked by fUZZ.

1 Introduction

Real vector spaces are multidimensional generalizations of real numbers. They are the objects studied in linear algebra and are foundational to differential geometry.

2 Real *n*-tuples

2.1 $\mathbb{R}^{\infty} \setminus \mathtt{Rinf}$

Let n be a natural number. A finite sequence of n real numbers is called a real n-tuple. Let \mathbb{R}^{∞} denote the set of all real n-tuples for any n.

$$\mathbb{R}^{\infty} == \operatorname{seq} \mathbb{R}$$

2.2 \mathbb{R} \setminus Rtuples

Let $\mathbb{R}(n)$ denote \mathbb{R}^n , the set of all *n*-tuples for some given *n*.

$$\begin{array}{|c|c|} \hline \mathbb{R}: \mathbb{N} \longrightarrow \mathbb{P} \, \mathbb{R}^{\infty} \\ \hline \forall \, n: \mathbb{N} \bullet \\ \hline \mathbb{R}(n) = \{ \, v: \mathbb{R}^{\infty} \mid \#v = n \, \} \end{array}$$

2.2.1 $\pi \pi$

The real numbers that comprise an n-tuple are called its components. The real number v(i) is the i-th component of the n-tuple v where $1 \le i \le n$. Let $\pi(i)$ be the projection function that maps an n-tuple v to its i-th component v(i).

```
 \begin{array}{c|c} \pi: \mathbb{N}_1 \longrightarrow \mathbb{R}^{\infty} \longrightarrow \mathbb{R} \\ \hline \forall \, i: \mathbb{N}_1 \bullet \\ \pi(i) = (\lambda \, v: \mathbb{R}^{\infty} \mid i \in \mathrm{dom} \, v \bullet v(i)) \end{array}
```

3 Scalar Multiplication

Let v be an n-tuple and let c be a real number. Scalar multiplication of v by c is the n-tuple c * v defined by component-wise multiplication.

```
\begin{array}{c|c}
-*-: \mathbb{R} \times \mathbb{R}^{\infty} \longrightarrow \mathbb{R}^{\infty} \\
\hline
\forall c : \mathbb{R} \bullet \\
c * \langle \rangle = \langle \rangle \\
\hline
\forall c : \mathbb{R}; n : \mathbb{N}_{1} \bullet \\
\forall v : \mathbb{R}(n); i : 1 \dots n \bullet \\
(c * v)(i) = c * v(i)
\end{array}
```

4 Vector Addition and Subtraction

Let v and w be n-tuples. Vector addition of v and w is the n-tuple v + w defined by component-wise addition.

$$-+ : \mathbb{R}^{\infty} \times \mathbb{R}^{\infty} \to \mathbb{R}^{\infty}$$

$$dom(-+-) = \{ v, w : \mathbb{R}^{\infty} \mid \#v = \#w \}$$

$$\langle \rangle + \langle \rangle = \langle \rangle$$

$$\forall n : \mathbb{N}_{1} \bullet$$

$$\forall v, w : \mathbb{R}(n); i : 1 ... n \bullet$$

$$(v + w)(i) = v(i) + w(i)$$

Vector subtraction is defined similarly.

Each $\mathbb{R}(n)$ is a real vector space under the operations of scalar multiplication and vector addition defined above.

5 Linear Transformations

Let n and m be natural numbers. A mapping L from \mathbb{R}^n to \mathbb{R}^m is said to be a linear transformation if it preserves scalar multiplication and vector addition.

```
Linear
n, m : \mathbb{N}
L : \mathbb{R}^{\infty} \to \mathbb{R}^{\infty}
L \in \mathbb{R}(n) \to \mathbb{R}(m)
\forall c : \mathbb{R}; v : \mathbb{R}(n) \bullet
L(c * v) = c * L(v)
\forall v, w : \mathbb{R}(n) \bullet
L(v + w) = L(v) + L(w)
```

Define lin(n, m) to be the set of all linear transformations from \mathbb{R}^n to \mathbb{R}^m .

$$\begin{array}{|c|c|} & \operatorname{lin}: \mathbb{N} \times \mathbb{N} \longrightarrow \mathbb{P}(\mathbb{R}^{\infty} \longrightarrow \mathbb{R}^{\infty}) \\ \hline & \forall \, n, m : \mathbb{N} \bullet \\ & & \operatorname{lin}(n, m) = \{ \, L : \mathbb{R}^{\infty} \longrightarrow \mathbb{R}^{\infty} \mid Linear \, \} \end{array}$$

6 The Dot Product

The inner or dot product of n-tuples v and w is the real number $v \cdot w$ defined by the sum of the component-wise products.

Each $\mathbb{R}(n)$ is a real inner product space under the operation of dot product defined above.

7 The Norm

The norm ||v|| of the *n*-tuple v is the positive square root of its dot product with itself.

$$||v|| = \sqrt{v \cdot v}$$

Define norm(v) to be ||v||.

The concepts of continuity, limits, and differentiability extend to functions between normed vector spaces such as \mathbb{R}^n .

8 Differentiability

Let $f: \mathbb{R}^n \to \mathbb{R}^m$ and let $x \in \mathbb{R}^n$. Then f is differentiable at x if there exists a linear transformation $L: \mathbb{R}^n \to \mathbb{R}^m$ such that f is approximately linear very near x.

$$f(x+h) \approx f(x) + L(h)$$
 when $||h|| \approx 0$
